

COEN 169 Web Information Management

Project II (100 points + 40 bonus points)

Deadline 1: First submission, May 25, 2017

Deadline 2: Report and Code, 12:10pm, Thursday, June 1, 2017

Introduction

In this assignment, you will develop different algorithms to make recommendations for movies.

You are free to choose *any programming language that you like* such as Python, R, C/C++, Java, or Matlab.

Movie Recommendation System

The Training Data

The training data: a set of movie ratings by 200 users (userid: 1-200) on 1000 movies (movieid: 1-1000). The data is stored in a 200 row x 1000 column table. Each row represents one user. Each column represents one movie. A rating is a value in the range of 1 to 5, where 1 is "least favored" and 5 is "most favored". **Please NOTE that a value of 0 means that the user has not explicitly rated the movie.**

Please download the training data here: [train.txt](#).

The Test Data

There are three test files: [test5.txt](#), [test10.txt](#) and [test20.txt](#).

[test5.txt] A pool of movie ratings by 100 users (userid: 201-300). Each user has already rated 5 movies. The format of the data is as follows: the file contains 100 blocks of lines. Each block contains several triples : (U, M, R), which means that user U gives R points to movie M. **Please note that in the test file, if R=0, then you are expected to predict the best possible rating which user U will give movie M.** The following is a block for user 276. (line 6545-6555 of test5.txt)

```
276 42 4    // user 276 gives movie 42 4 points.
276 85 2    // user 276 gives movie 85 2 points.
276 194 5   // user 276 gives movie 194 5 points.
```

```
276 208 5    // user 276 gives movie 208 5 points.
276 585 1    // user 276 gives movie 585 1 point.
276 4 0      // need to predict user 276's rating for movie 4
276 26 0     // need to predict user 276's rating for movie 26
276 33 0     ...
276 56 0
276 63 0
276 67 0
276 72 0
```

ATTENTION: Please make the prediction block by block: every time when you are making predictions for user U, please assume that you **ONLY** know the knowledge of the training data (train.txt) and the existing 5 ratings for this user. In other words, please **DO NOT** use the knowledge of any other blocks in the test file when making predictions.

The format of test10.txt and test20.txt is nearly the same as test5.txt, the only difference is that: in test10.txt, 10 ratings are given for a specific user; in test20.txt, 20 ratings are given for a specific user.

How to get the accuracy?

To get the accuracy of your predictions, please submit the predicted ratings to our online system. You can submit up to 30 trials and please record the error rates for different algorithms. The real-time ranking system is showing your best submission. (For more information, please check the help page of our grading system.).

You can access the online system via submit.html.

Tasks

Your task is to design and develop collaborative filtering algorithms that predict the unknown ratings in the test data by learning users' preference from the training data.

Please complete the following experiments:

0. Submit your first results by May 25 no matter what they are (20 points)

1. User-Based Collaborative Filtering Algorithms (30 points)

1.1 Implement the basic user-based collaborative filtering algorithms

Please implement two versions of the basic user-based collaborative filtering algorithm as the cosine similarity method and Pearson Correlation method.

1.2 Extensions to the basic user-based collaborative filtering algorithms

Please implement the following two modifications to the standard algorithm (using Pearson Correlation): 1. Inverse user frequency; 2. Case modification.

2. Item-Based Collaborative Filtering Algorithm (10 points)

Please implement the item-based collaborative filtering algorithm based on adjusted cosine similarity.

3. Implement your own algorithm (20 points)

You can try various heuristics to improve your recommendation performance. The grading will be based on the performance and novelty of your algorithm.

4. Results Discussion (20 points)

Please provide the following information

Summarize the error rates (MSE) of the various algorithms in a table. Do you think your results are reasonable? Please compare and analyze the advantages and disadvantages of the different algorithms that you implement.

Bonus:

Results Competition (40 points)

40 points will be assigned according to the performance of your recommendation system. The best performance of the algorithms from each student will be recorded and compared.

1: 40

2-3: 38

4-7: 34

8-12: 30

13-16: 26

17-20: 22

21-24: 18

25-28: 14

29-32: 10

33-36: 6

37-40: 2

Rest: 0

What to turn in

1. Please write a report of your experiments and submit a hard copy of your report by the deadline.
2. Please send your code to yfang@scu.edu by the deadline.
